

Electric/Hybrid Vehicle and Emission Reduction Policy

As Margün Enerji, we are committed to decarbonization in our operational activities. Although we do not cause carbon emissions during our renewable energy production oriented activities, our direct and indirect carbon emissions generally arise from the use of fossil fuel vehicles. For this reason, we initiate the conversion of our vehicles used in daily activities into electric/hybrid vehicles. In this respect;

- The purchase of electric/hybrid vehicles to be used in the daily activities of the company after 2021,
- Establishment of electric charging station or purchase of service from the companies providing this service,
- Prioritizing the use of electric/hybrid vehicles in vehicle rental or taxi use and meeting this difference by the Company in case of a fee difference,
- 20% of the interest to be paid in the event that the employees buy an electric vehicle (20%of the interest corresponding to the part up to the 3-year maturity at the lowest interest rate on the market up to the 50% of the vehicle rental price in the event that it is purchased entirely with equity) shall be covered by the Company,
- Converting all vehicles of the Company into electric vehicles by 2030,
- The office buildings to be purchased or rented, including the office to be opened in Istanbul, should have public transportation connections such as metro and train and these buildings should be prioritized to have vehicle charging stations,

We declare and undertake.
